DEPARTMENT OF COMPUTER SCIENCE

Group #1: Online Banking Transaction

Phase 4

:Instructor

Database Design

BY

Abstract

Online banking transaction allows customers of a particular bank to perform financial transactions on a secure website maintained by the bank or credit union. Customers with a valid user id and password can perform an online transaction. This system provides the following facilities for a valid user:

- Balance Inquiry
- Deposit
- Withdrawal
- Funds transfer within and outside the bank
- Viewing monthly and annual statements

Problem Statement

In our online-banking transaction, there are users. Users are those people who have an account with the bank. Each user has an account number, account type, name, valid ID, valid password, address, joining date, phone number and email address. Users also have the option to have multiple accounts.

There are several services that users would like to get from the online-banking system, including balance checking, making deposit and withdrawal, transaction checking and viewing their information.

Regarding online transactions, every user has the option to request details of the transactions he/she has performed within a certain period. Each transaction will have a unique transaction id. Transactions include the following types:

- Deposit
- Withdraw
- Fund transfers
- Pay Bills

In order to transfer funds from a user's account, the user has to provide the following information to add an account to transfer to:

- User's account number
- Recipient's name
- Recipient's account number
- Recipient's account type (Checking/Savings)
- Recipient's zip code
- Nickname (description of the transaction). This field would be optional.

There are different types of fund transfers that can take place.

- **TRANSFERRING WITHIN THE BANK**

Users can transfer funds from his account to any other account in the same bank. If the transaction is successful a notification should appear to the user, in case it is unsuccessful, a proper message should be given to the customer as to why it failed. In order for this transaction to happen, the user has to fill in the recipient's account number, amount to transfer, and frequency of transfer (One-Time, weekly, monthly and annually).

- **TRANSFERRING OUTSIDE THE BANK**

Users can transfer funds from his account to any other account in a different bank. If the transaction is successful a notification should appear to the user, in case it is unsuccessful, a proper message should be given to the customer as to why it failed. In order for this

transaction to happen, the user has to fill in the recipient's routing number(9 digit) or bank name, account number, amount to transfer, and frequency of transfer (One-Time, weekly, monthly and annually).

Users can also pay their bills (like phone or electricity bills). For this to happen, the user has to initially save the payee's information like:

- company name or individual name
- User Account number
- Payee Zip code

In order to make a pay, user has to enter:

- the amount to be paid
- the date of payment

Queries

1. Retrieve the account balances for user-id “ABC”.
2. Retrieve the transaction history for account number “123456789” from Jan 01, 2008 to Mar 15, 2008.
3. Retrieve all transactions that are either deposit or withdrawal for an account number “123456789”.
4. Retrieve all customers who have a balance greater than 100,000.
5. Retrieve the number of customers and the maximum balance for each account type.
6. For each user having at least two accounts, retrieve the name, account number and balance for each account.
7. Customer wants to transfer funds from their account to a different account within the bank.
8. Customer wants to transfer funds from their account to a different account outside the bank.
9. Customer may want to pay their bills from a particular account.
10. Customer wants to view their personal information.
11. Customer may want to add an account.
12. Customer may want to manage their account like updating their personal information.

Conceptual Design

Entities:

USERS, TAX, TRANSACTION, ACCOUNT, TRANSFER, PAYEE, CREATES, TRANSFER

Weak Entity:

STATEMENT

Attributes:

- ❖ USERS – Name, User ID, Password, Address, Phone, Email, SSN, LoginDate, Role
- ❖ STATEMENT – Account No, Start Date, End Date
- ❖ ACCOUNT – Account number, type, balance
- ❖ TRANSACTION – ID, Type, Amount, Balance, Account No, Date, PayeeID, Deliver, TransID
- ❖ TRANSFER – Transfer ID, Type, UserID, Name, Account No, ZIP, Route No, Active
- ❖ PAYEE – ID, UserID, Name, Account No, ZIP
- ❖ CREATES – Account No, UserID, JoinDate
- ❖ TAX – SSN, Tax

Relationship:

- ❖ User deposits and withdraws to/from their account.
- ❖ User transfer funds within and outside the bank.
- ❖ User adds a payee.
- ❖ User performs a transaction from a particular account.
- ❖ User requests for statements.

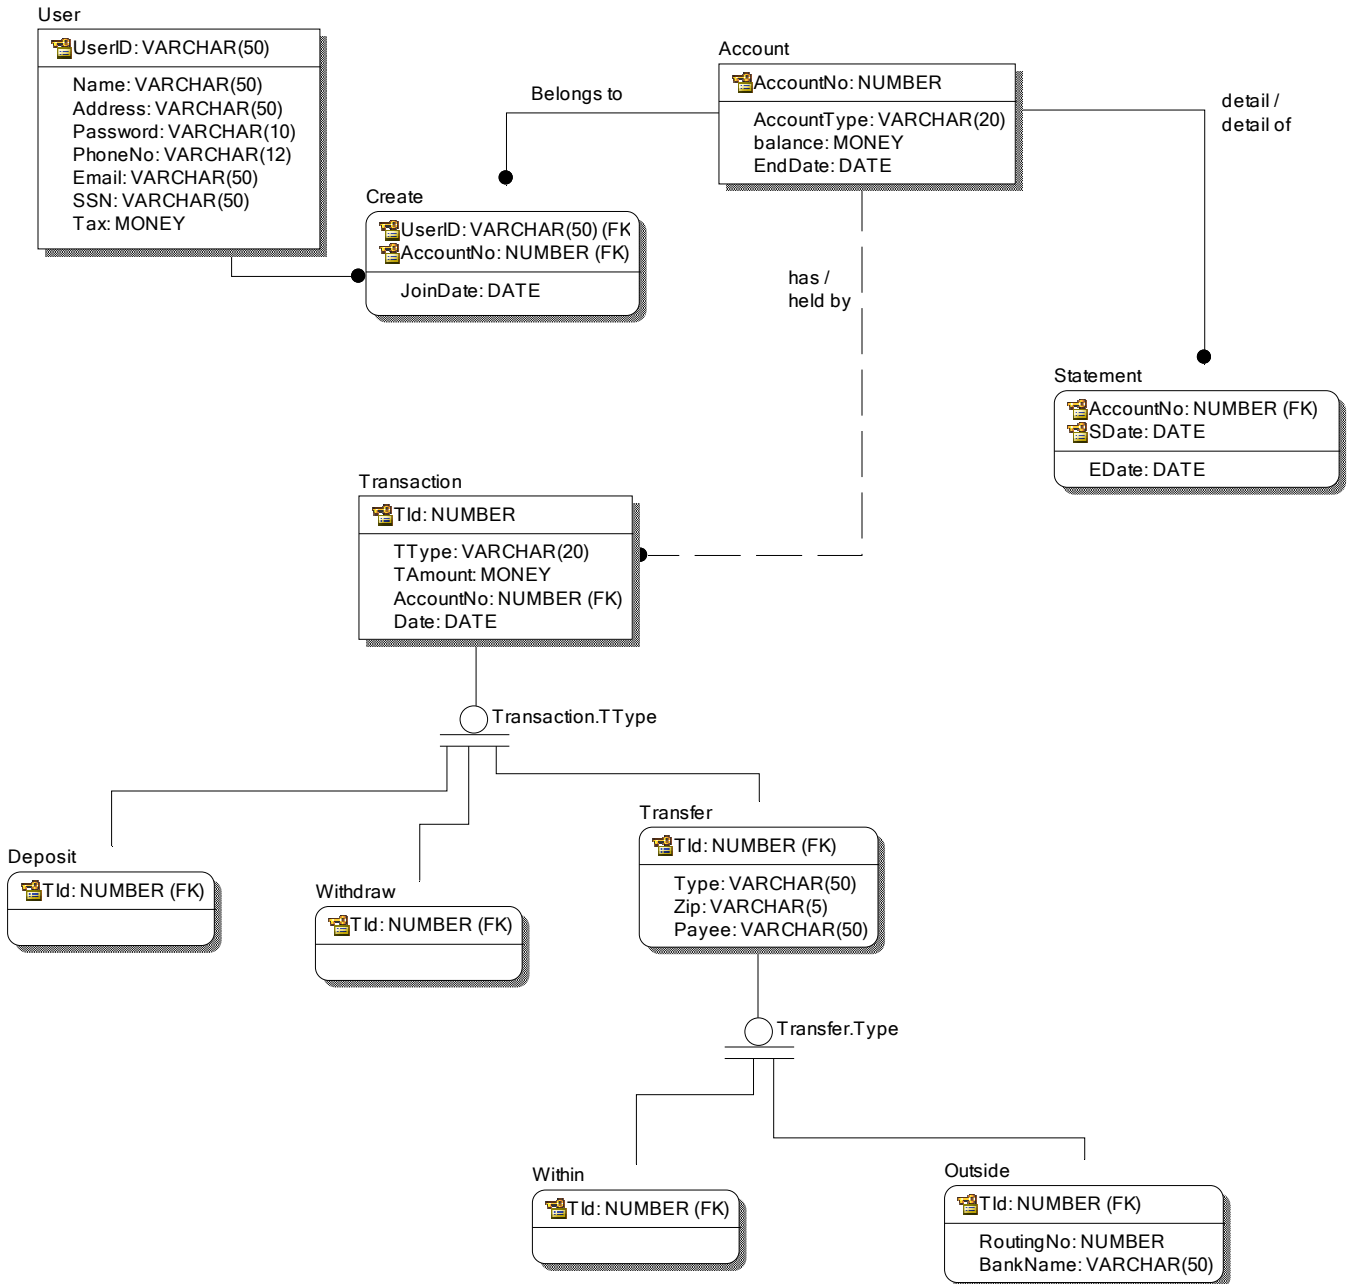

Attributes of relationship types:

- ❖ Transfer Outside Bank – Bank ID
- ❖ User manages account – Join date

Keys:

- ❖ USERS - User ID
- ❖ TAX – SSN
- ❖ ACCOUNT - Account Number
- ❖ TRANSACTION – Transaction ID
- ❖ TRANSFER – Transfer ID
- ❖ PAYEE – Payee ID
- ❖ CREATES – Account No
- ❖ STATEMENT – Account No

❖ EER Modeling

Mapping to Relations

Step 1: Mapping of Regular entity types

We create the relations USERS, TRANSACTION, ACCOUNT, PAYEE and TRANSFER in the relational schema corresponding to the regular entities in the ER diagram. UserID is taken as a primary key. It can be used in case if a customer doesn't have a SSN.

USERS

<u>USERID</u>	NAME	ADDRESS	PASSWORD	PHONENO	EMAIL	SSN	Tax
---------------	------	---------	----------	---------	-------	-----	-----

TRANSACTION

<u>TID</u>	TTYPE	TAMOUNT	ACCTNO	DATE
------------	-------	---------	--------	------

ACCOUNT

<u>ACCOUNTNO</u>	ATYPE	BALANCE
------------------	-------	---------

Step 2: Mapping of Weak Entity Types

We create the relation STATEMENT in this step to correspond to the weak entity type.

STATEMENT

<u>ACCOUNTNO</u>	<u>SDATE</u>	EDATE
------------------	--------------	-------

Step 3: Mapping of Binary 1:1 Relation Types

STATEMENT is a 1:1 relationship between ACCOUNT and STATEMENT.

STATEMENT (E1)

FK		
<u>ACCOUNTNO</u>	<u>SDATE</u>	EDATE

ACCOUNT (E2): The ACCOUNT relation is unchanged from step 1

<u>ACCOUNTNO</u>	ACCOUNTTYPE	BALANCE
------------------	-------------	---------

Step 4: Mapping of Binary 1:N Relationship Types.

TRANSACTION

			FK	
<u>TID</u>	TTYPE	TAMOUNT	ACCOUNT NO	DATE

ACCOUNT

<u>ACCOUNTNO</u>	ACCOUNTTYPE	BALANCE
------------------	-------------	---------

Step 5: Mapping of Binary M:N Relationship Types

USER

<u>USERID</u>	NAME	ADDRESS	PASSWORD	PHONENO	EMAIL	SSN	Tax
---------------	------	---------	----------	---------	-------	-----	-----

CREATES

<u>ACCOUNTNO</u>	USERID	JOINDATE
------------------	--------	----------

ACCOUNT

<u>ACCOUNTNO</u>	ATYPE	BALANCE
------------------	-------	---------

Step 6 and Step 7:

There is neither mapping of multivalued attributes nor mapping of N-ary relationship types.

Step 8: Mapping Specialization or Generalization

(a)

TRANSACTION

<u>TID</u>	TTYPE	TAMOUNT	ACCTNO	DATE
------------	-------	---------	--------	------

DEPOSIT

<u>TID</u>

WITHDRAW

<u>TID</u>

TRANSFER

<u>TID</u>	TYPE	ZIP	PAYEE
------------	------	-----	-------

(b)

TRANSFER

<u>TID</u>	TYPE	ZIP	PAYEE
------------	------	-----	-------

WITHIN

<u>TID</u>

OUTSIDE

<u>TID</u>	RNO	BNAME
------------	-----	-------

Result of mapping the ONLINE BANKINGER schema into a relational schema

USERS

<u>USERID</u>	NAME	ADDRESS	PASSWORD	PHONENO	EMAIL	SSN	Tax
---------------	------	---------	----------	---------	-------	-----	-----

CREATES

<u>ACCOUNTNO</u>	USERID	JOINDATE
------------------	--------	----------

ACCOUNT

<u>ACCOUNTNO</u>	ATYPE	BALANCE
------------------	-------	---------

TRANSACTION

<u>TID</u>	TTYPE	TAMOUNT	ACCTNO	DATE
------------	-------	---------	--------	------

DEPOSIT

<u>TID</u>

WITHDRAW

<u>TID</u>

TRANSFER

<u>TID</u>	TYPE	ZIP	PAYEE
------------	------	-----	-------

WITHIN

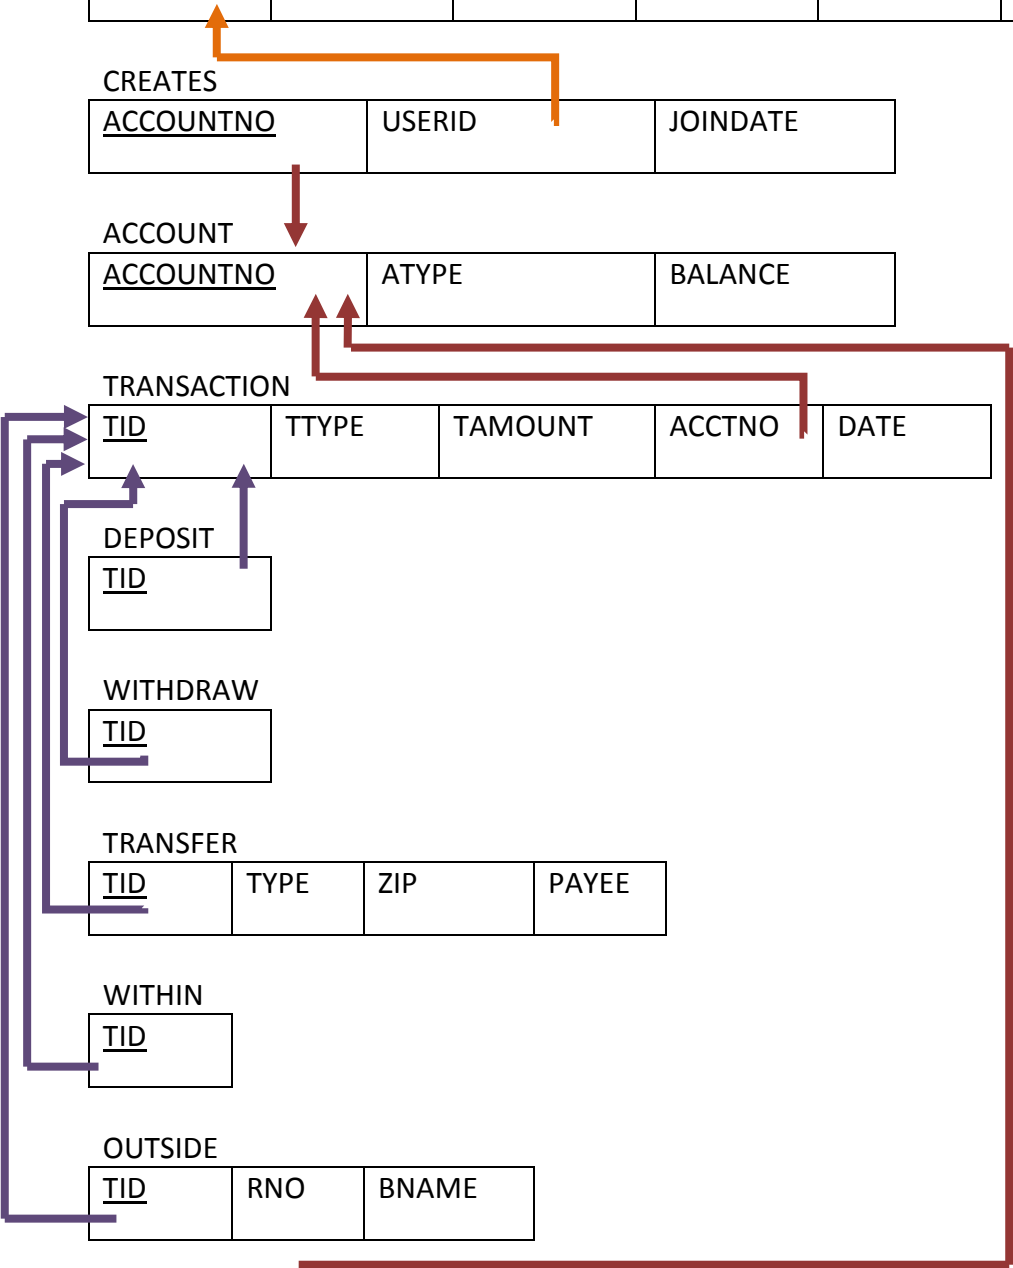

<u>TID</u>

OUTSIDE

<u>TID</u>	RNO	BNAME
------------	-----	-------

STATEMENT

<u>ACCOUNTNO</u>	<u>SDATE</u>	EDATE
------------------	--------------	-------

Functional Dependencies

USERS

CREATES

ACCOUNT

TRANSACTION

TRANSFER

STATEMENT

Normalization

1NF: USER is in 1NF

2NF: USER is in 2NF

3NF: USER is in 3NF

BCNF: There is transitive dependency between USERID and Tax, since USERID → SSN and SSN → Tax holds.

Solution to BCNF:

USER (USERID, NAME, ADDRESS, PASSWORD, PHONENO, EMAIL, SSN)

TAX (SSN, Tax)

Relational Algebra

1. Retrieve the account type and balance for each account user-id "ABC" has.

$$R1 \leftarrow \Pi_{\text{AccountNo}} (\sigma_{\text{UserID}='ABC'} (\text{CREATE}))$$
$$\text{Result} \leftarrow \Pi_{\text{Balance}} (R1 \bowtie_{R1.\text{AccountNo} = \text{Account}.\text{AccountNo}} \text{ACCOUNT})$$

2. Retrieve the transaction history, including transaction ID, type, amount of money, and date, for account number "100000000011" from Jan 01, 2000 to Mar 15, 2008.

$$\begin{aligned} \text{Result} \leftarrow & \sigma_{\text{AccountNo} = 100000000011 \text{ AND}} (\text{TRANSACTION}) \\ & \text{Date} \geq \text{Jan 01, 2000 AND} \\ & \text{Date} \leq \text{Mar 15, 2008} \end{aligned}$$

3. Retrieve all transactions that are either deposit or withdrawal for an account number "100000000011".

$$\begin{aligned} & \sigma_{\text{AccountNo} = 100000000011 \text{ AND}} (\text{TRANSACTION}) \cup \sigma_{\text{AccountNo} = 100000000011} (\text{TRANSACTION}) \\ & \text{TType} = \text{'Deposit'} \qquad \qquad \qquad \text{TType} = \text{'Withdraw'} \end{aligned}$$

4. Retrieve all customers who have a balance greater than 100,000.

$$R1 \leftarrow \sigma_{\text{Balance} > 100000} (\text{ACCOUNT})$$
$$\text{Result} \leftarrow \Pi_{\text{UserID}}, (R1 \bowtie (*) \text{CREATES})$$

Balance,
ATYPE

5. Retrieve the number of customers and the maximum balance for each account type.

$$\begin{aligned} & \text{AType F}_{\text{COUNT}(\text{UserID})}, (\text{CREATES} * \text{ACCOUNT}) \\ & \text{MAX} (\text{Balance}) \end{aligned}$$

```

Drop Script

```

DROP TABLE USERS;

DROP TABLE TAX;

DROP TABLE CREATES;

DROP TABLE ACCOUNT;

DROP TABLE TRANSACTION;

```

```

DROP TABLE TRANSFER;

DROP TABLE STATEMENT;

DROP VIEW TRANSFER_VIEW;

DROP VIEW VIP_ID;

DROP VIEW NAME_VIEW;

DROP VIEW TEMP;

```

SQL Script

1. Retrieve the account type and balance for each account user-id “SMITH3623” has.

```

select atype as acct_type, balance
from account
where accountno in (select accountno
                    from creates
                    where userid = 'SMITH3623');

```

2. Retrieve the transaction history, including transaction ID, type, amount of money, and date, for account number “100000000011” from Jan 01, 2000 to Mar 15, 2008.

```

select tid, ttype, tamount, tdate
from transaction
where acctno = '100000000011'
      AND tdate >= to_date('01/01/2000', 'mm/dd/yyyy')
      AND tdate <= to_date('03/15/2008', 'mm/dd/yyyy')
order by tdate;

```

3. Retrieve all transactions that are either deposit or withdrawal for an account number “100000000011”.

```

select *
from transaction
where acctno = '100000000011'
      AND (ttype = 'DEPOSIT' OR ttype = 'WITHDRAW');

```

4. Retrieve all customers who have a balance greater than 100,000.

```

create view vip_id
as select distinct userid
from creates c JOIN account a ON c.accountno = a.accountno
where a.balance >= 1000000;

select name
from users u, vip_id v
where u.userid = v.userid;

```

5. Retrieve the number of customers and the maximum balance for each account type.

```
select atype, count(distinct userid) as users, max(balance) as Max_Balance
  from (select *
        from creates c, account a
        where c.accountno = a.accountno)
  group by atype;
```

6. For each user having at least two accounts, retrieve the name, account number and balance for each account.

```
-- step1: create view to list all the name who have at least two accounts
```

```
create view name_view as
select name, userid
  from users
 where userid in (select c.userid
                 from creates c
                 group by c.userid
                 having count(*) >= 2);
```

```
-- step2: create view to list all the name, userid, accountno who have at
least two accounts
```

```
create view temp as
select n.name, n.userid, c.accountno
  from name_view n, creates c
 where n.userid = c.userid;
```

```
-- step3: Final solution
```

```
select t.name, t.userid, t.accountno, a.atype, a.balance
  from temp t, account a
 where t.accountno = a.accountno;
```

Implementation

The project was developed by keeping in mind the following specifications:

- Operating System: Windows NT
- Developmental Tool: MS Visual Studio 2005
- Programming Languages: ASP.NET
 - Server Side: C#
 - Client Side: Javascript
- Database: Oracle Client 10.2.0

Below are the screenshots of our Online Banking Website. There are two main sections called, User and Administrator.

User Sections:

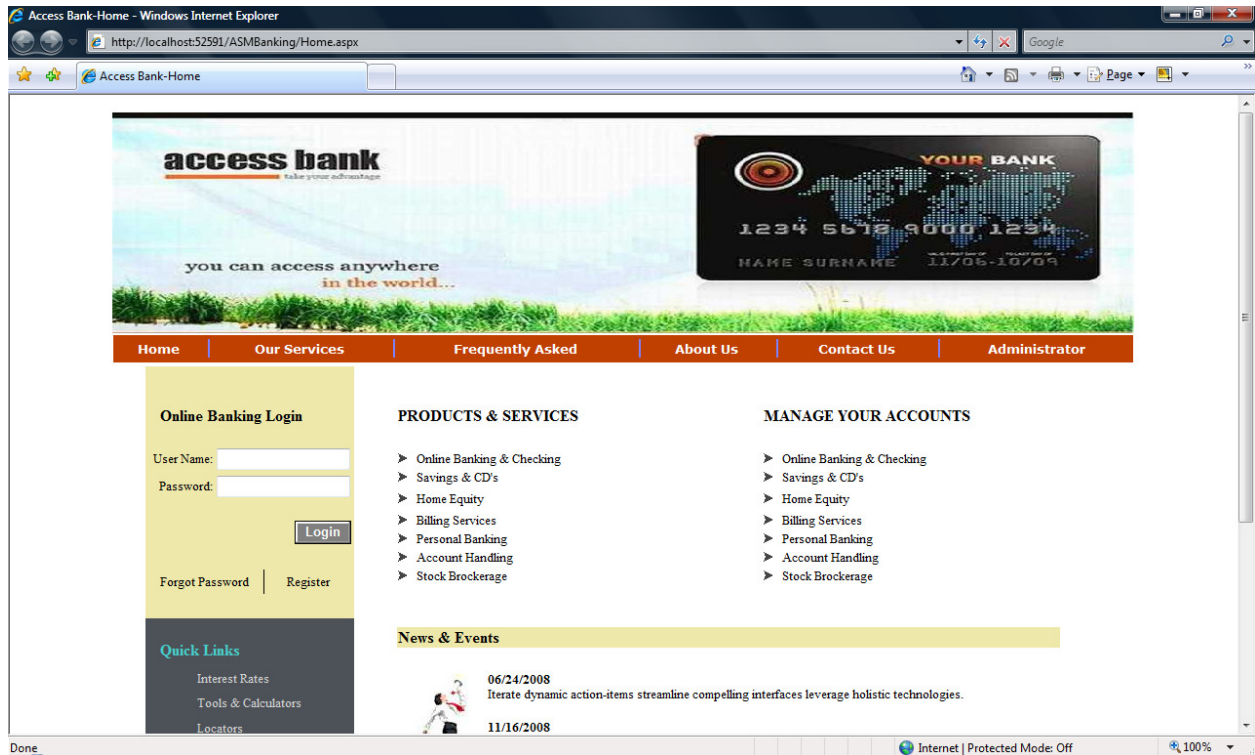

Fig: Bank Homepage

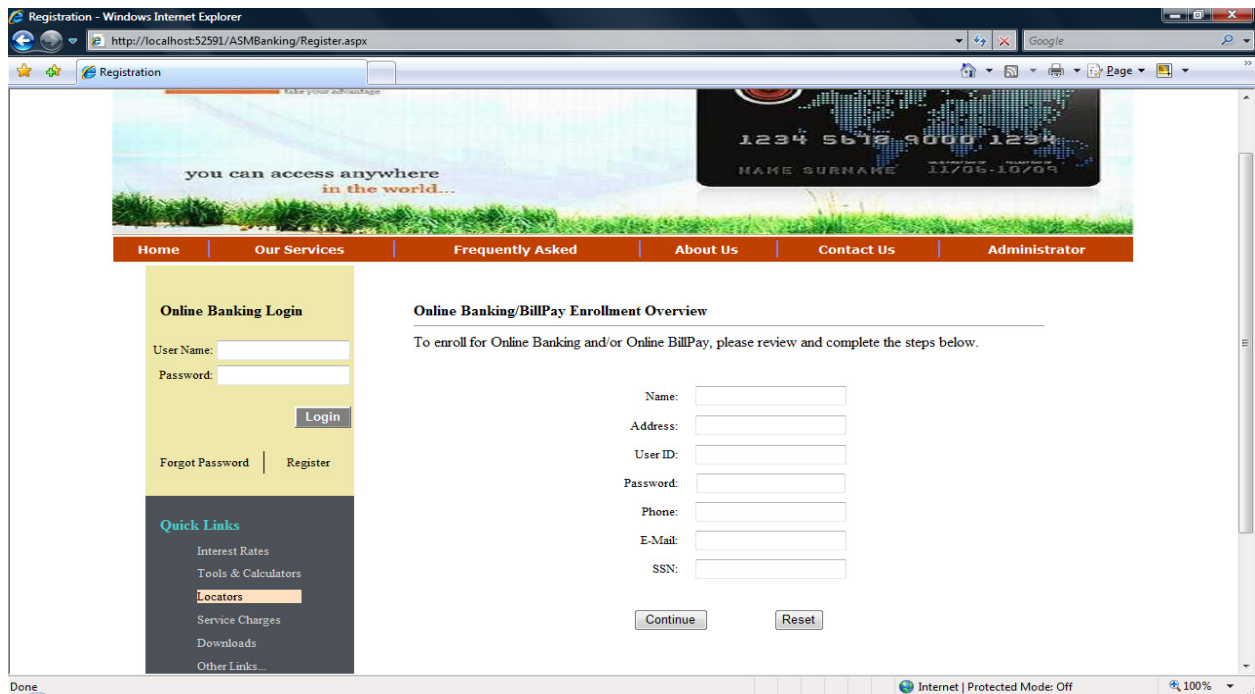

Fig: Registration page to access the online banking system

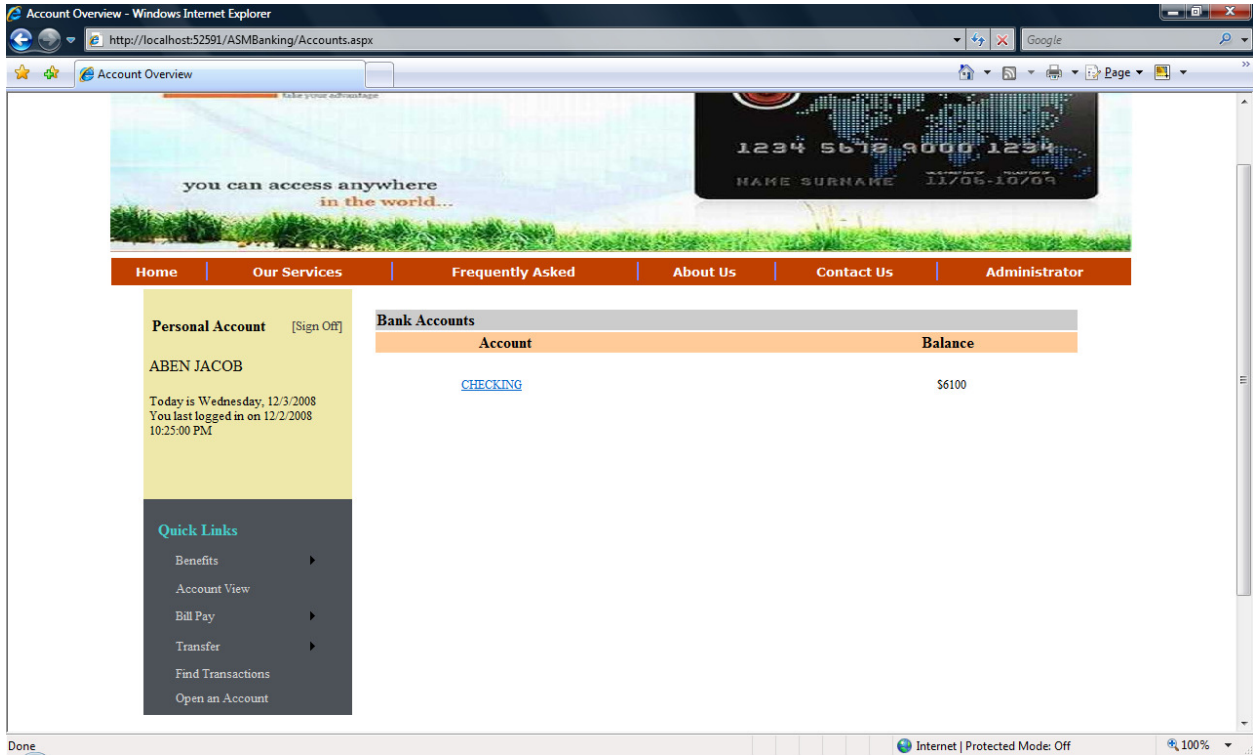

Fig: User Profile Page – Accounts

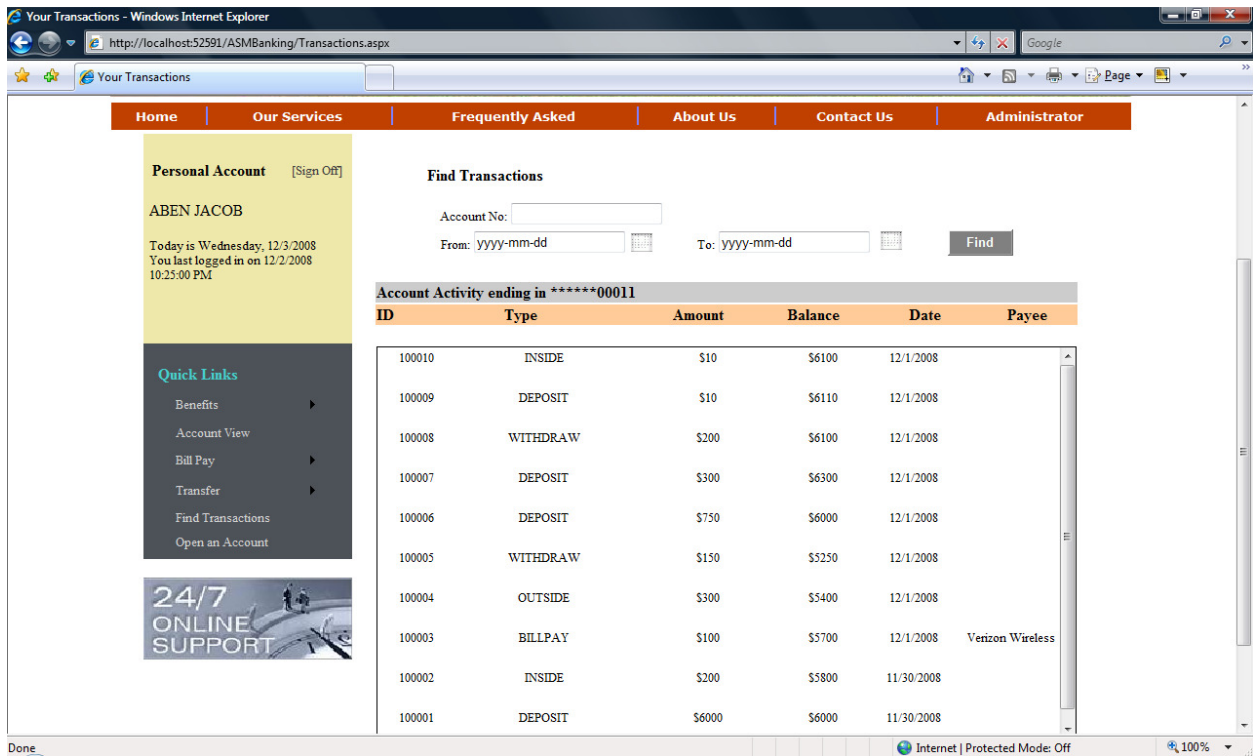

Fig: Transactions

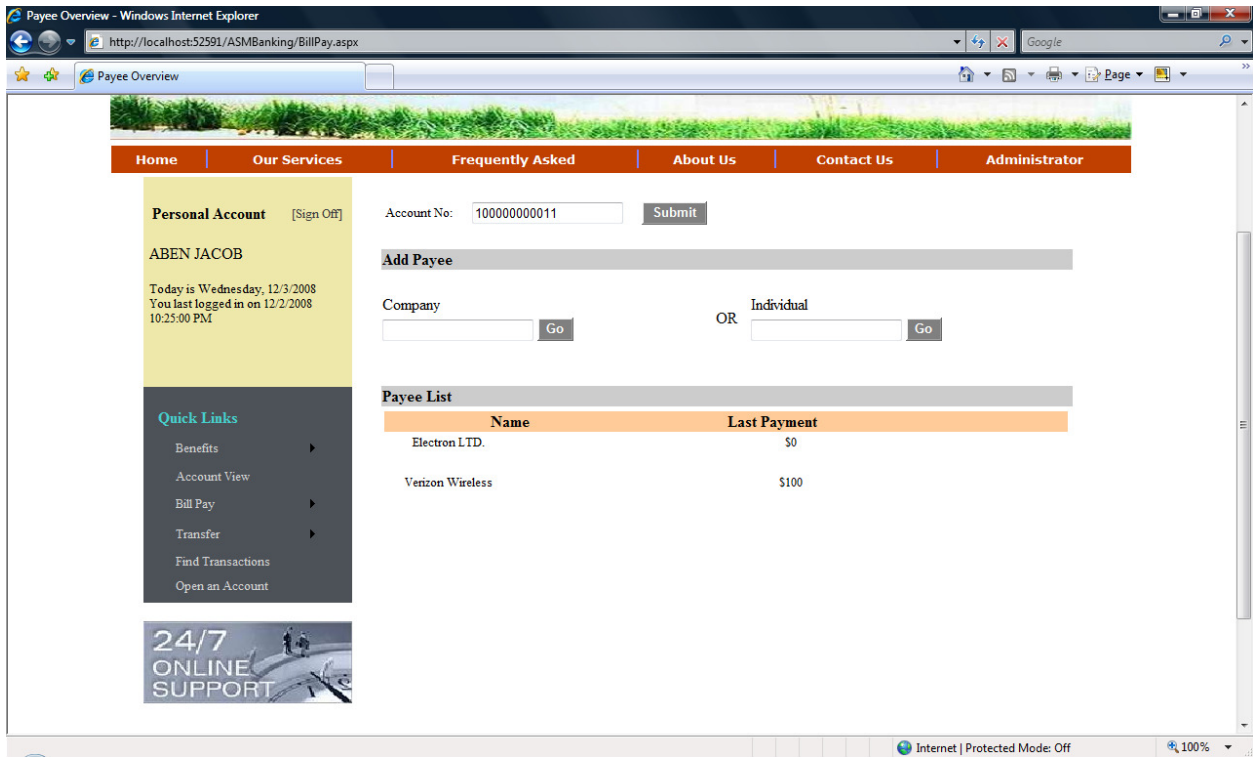

Fig: Payee List

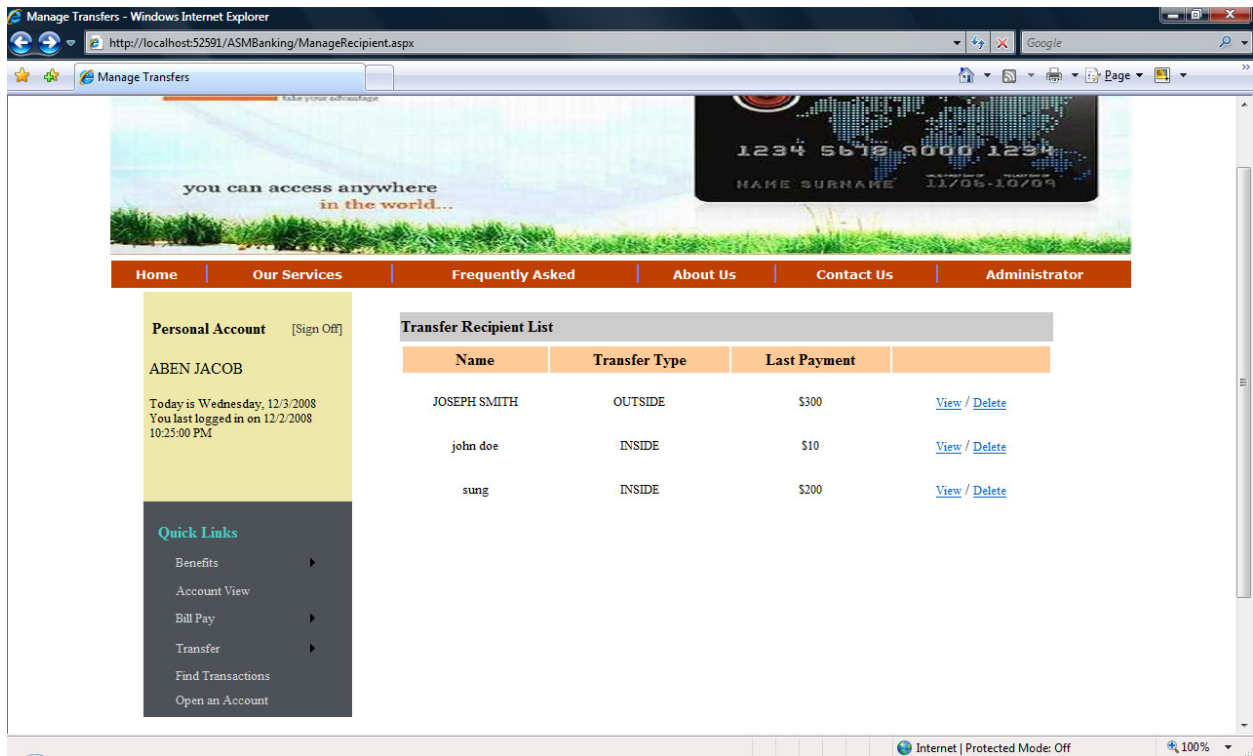

Fig: Transfer List

Administrator Sections:

The screenshot shows a web browser window titled "View Users - Windows Internet Explorer" with the URL "http://localhost:52591/ASMBanking/ViewUsers.aspx". The page features a navigation menu with "Home", "Our Services", "Frequently Asked", "About Us", "Contact Us", and "Administrator". On the left, there is an "Admin Account" section for "SUNGHO CHO" with a "[Sign Off]" link and a "Quick Links" menu containing "Users", "Accounts", "Administrators", and "Transactions". The main content area is titled "View all Registered Users" and contains a table with the following data:

Name	UserID	Address	Email	
aben jacob	aben	150 marina park cir, CT	aben@gmail.com	Edit / Delete
john doe	jj123	123 fdtlg, CT 06604	jd@gmail.com	Edit / Delete

Below the table is a form for editing a user's details, with fields for Name (aben jacob), UserID (aben), Address (150 marina park cir, CT), and Email (aben@gmail.com), along with "Submit" and "Cancel" buttons.

Conclusion

By doing this project we were able to better understand the various concepts of any database. We learned how to create web pages. Finally, using C# we were able to figure out how to connect to .an Oracle server Database
